

Abstract of the Disclosure:

An electromechanically actuated outrigger assembly includes a main body having a bearing point. An outrigger support is to be connected to an outrigger boom. The support is pivotally connected to the main body at the bearing point. An electrical actuator is connected to the main body and has a movable piston. A lever assembly operatively connects the outrigger support to the piston to pivot the outrigger support about the bearing point when the piston moves. The lever assembly has a piston connection point offset vertically and laterally from the bearing point and is connected to the piston at the piston connection point, preferably, in a pivotal connection.
